

What is Feeding Therapy? Feeding therapy brings awareness to the movements of the mouth from bottles to cups and straws to chewing, swallowing and learning to successfully eat a variety of textures of foods. We have specialized training in a variety of feeding therapy approaches as well as identifying tongue and lip ties. Orofacial myology therapy is available.

What is Lactation Therapy?

Lactation therapy helps infants and mothers successfully breastfeed. Support is also offered for pumping, increasing milk supply and concerns including poor latch, tongue/lip tie, mastitis, plugged ducts, etc. Intervention is provided by an IBCLC and a CLS on staff.

Pediatric Therapy Services

Our Mission Statement: “To help children develop the skills necessary to reach their highest potential. We believe there are no limits to what these Kids Can Do. We strive to provide exceptional therapy services by supporting and promoting inclusion for each family we serve. Our desire is for each child to learn, grow, and succeed in our community.”

About Our Services: Ephraim McDowell Kids Can Do Pediatric Therapy Center is a stand-alone, dedicated facility providing the most comprehensive pediatric therapy in south central Kentucky to include occupational therapy, physical therapy, speech, feeding and lactation intervention for children ages birth to 21. We are staffed by experienced therapists who are committed to offering research-based, data-driven interventions. We use a team approach to provide individualized care, involving families while promoting each child’s development and independence.

What is Pediatric Speech Therapy?

Speech therapy equips infants and children to communicate, understand and follow directions, and pronounce words correctly. We have training in evaluation and intervention for using communication systems (AAC), apraxia of speech, stuttering, feeding interventions and the foundations for reading.

What is Pediatric Occupational Therapy?

Occupational therapy is a service that promotes independence and development of fine motor skills, visual-motor skills, sensory regulation/integration and self-care skills that infants and children need to be successful for eating, socializing, playing, academic activities, dressing and toileting.

What is Pediatric Physical Therapy?

Physical therapy is an intervention promoting the development of gross motor movement, which infants and children need to successfully reach developmental milestones including sitting, crawling, walking, jumping, skipping or using the stairs. It also promotes play by moving through their environments safely and sometimes ease pain associated with movement patterns. Infants can receive specialized treatment to improve tightness in their necks (torticollis) and flat spots on their heads (plagiocephaly).
